

Midi-Kaval — User Guide

This guide explains how to access, install, and use Midi-Kaval — the case management system for child-protection case work (DCPU/NGO field operations). It covers the web app, the mobile app (currently distributed as an APK, not yet on the Play Store), user roles, onboarding, and how a case actually moves through the system end to end.

No real account credentials are included anywhere in this guide — wherever a login is referenced, it uses a placeholder like `your-email@example.org`. Actual login details are provided to each user separately when their account is created.

1. Accessing the application

Web app

The web app is where Directors, Coordinators, Accountants, and Vendors do most of their work — case management, budgets, reports, admin, and reviewing/approving things submitted by field staff.

Open a modern browser (Chrome, Edge, Firefox, Safari) and go to one of the following, depending on which environment your administrator tells you is the "live" one for daily work:

- **Render:** <https://midi-kaval-web.onrender.com>
- **Self-hosted (Oracle Cloud):** <https://midi-kaval.duckdns.org>

Both point at independent deployments with their own separate database — they are not kept in sync with each other, so use whichever one your organisation has told you is current, not both interchangeably.

No installation is needed for the web app — just a browser and an internet connection.

Mobile app (Android)

The mobile app is built for field workers (Social Workers / Case Workers) doing home visits, logging court sittings, and submitting travel claims from the field, including while offline.

It is **not yet published on the Google Play Store** — for now it's distributed as a direct APK file. To install it:

1. Get the `app-release.apk` file from your administrator (downloaded from the project's build pipeline).
2. Transfer it to your Android phone (email attachment, cloud drive link, USB cable, whatever's easiest).
3. Tap the file to open it. Android will likely warn that installing apps from outside the Play Store is blocked by default — you'll be prompted to allow it for the app you used to open the file (e.g. your file manager, Gmail, Chrome). Follow the prompt to allow it, then tap **Install** again.
4. Once installed, open **Midi-Kaval** from your app drawer like any other app.
5. On first launch, grant the permissions it asks for — **Location** (needed for GPS verification during visits) and **Camera** (needed to photograph handwritten consent forms and landmark photos during a visit). You can decline these, but visit verification and photo capture won't work without them.

There's no auto-update mechanism yet — when a new version is released, you'll need to repeat the install steps above with the new APK file (Android will treat it as an update to the existing app, keeping your data, as

long as it's signed with the same key each time).

2. User roles

Every account has exactly one role, which determines what they can see and do:

Role	Typical user	Can do
Director	NGO/DCPU head	Everything — full case access, admin (invite/suspend users), budgets, reports, org settings, 2FA policy
Coordinator	Supervisor over a team of field workers	Case oversight and transfer, approving travel claims, budget viewing, the Crisis Queue (urgent items across the org)
Social Worker / Case Worker	Field worker	Assigned cases, home visits, court sittings, case notes, travel claims — this is who the mobile app is built for
Accountant	Finance/budget staff	Budget records, utilization tracking, financial reports
Vendor	External partner organisation	A restricted, separate view — their own organisation info, 2FA settings, and (as of a recent change) the ability to invite the very first Director account when setting up a brand-new deployment

3. Getting an account (onboarding)

There is no public "sign up" — every account is created by someone else already in the system.

If you're the very first person on a brand-new deployment

A fresh installation has no users at all. The **first** account (a Director) is created automatically the first time the server starts, using configuration your administrator sets up during deployment — it's not something you request through the app. Ask your administrator for that initial login.

Everyone else — invited by a Director

1. A Director goes to **Admin** → **Invitations** in the web app and sends an invite to your email address, choosing your role (Coordinator, Social Worker, Case Worker, or Accountant).
2. You receive an email with an activation link (valid for a limited time — currently a few days).
3. Click the link, set your own password, and your account is active.
4. If your organisation requires two-factor authentication, you'll be prompted to set that up (see [Section 7](#)) either immediately or on your first login.

Vendor accounts

Vendor accounts are separate from the Director/Coordinator/field-worker hierarchy and are set up directly by an administrator during deployment configuration, not through the in-app invitation flow.

4. How a case travels through the system

This is the core workflow — understanding it explains almost everything else in the app.

Creating a case

A Coordinator or Social Worker starts a new case from **Cases** → **New Case**. Before the case is actually created, the system runs a **duplicate check** — searching existing cases by name, crime number, and other identifying details — to catch a case that's already been entered under a slightly different spelling or reference number. If a likely duplicate is found, you're shown the match and asked to confirm before proceeding.

Some cases are flagged as sensitive (e.g. POCSO cases involving minors) — these get extra display protection (beneficiary names are shown discreetly, PII fields require an explicit "reveal" action that's logged, and additional access controls apply).

The six stages

Every case moves through six stages in order, each capturing a different phase of the casework:

1. **Process Initiation** — the initial intake: who the case is about, the incident, assigning a field worker.
2. **Maintain & Development** — ongoing support activities while the case is being actively worked.
3. **Inter-Sectoral Approach** — coordination with other agencies/departments involved in the case.
4. **Rehabilitation** — placement details (e.g. shelter home, foster arrangement).
5. **Reintegration** — the plan and progress for returning the beneficiary to a stable home/community setting.
6. **Termination & Exclusion** — formally closing the case, recording the outcome and reason for closure.

Each stage has its own data-entry form (visible under the case's detail page), and a case is moved to the next stage explicitly — it doesn't advance automatically. Once a case reaches **Termination & Exclusion** it's considered closed; some actions (like scheduling new visits) become unavailable on a closed case.

While a case is open

Alongside the six stages, several other things happen throughout a case's life, independent of which stage it's currently in:

- **Assignment / handoff** — a case can be transferred from one field worker to another (e.g. reassignment, staff change). When this happens, the new worker sees a **"Handoff Whisper"** — a short structured note (prior actions taken, open items, purpose of the next visit) left by whoever made the transfer, so context isn't lost. This is visible for a limited window right after the handoff.
- **Visits** — a field worker schedules, starts, and completes home visits tied to the case, each with GPS verification and a completion note. Visits can be rescheduled (with a reason) if needed, and can include one or more specific "places to visit" (addresses) that get logged individually.
- **Case notes** — free-text notes of different types (general, visit-related, court-related, intervention-related) can be added to the case timeline, optionally with an attached file (photo, PDF).
- **Interventions** — discrete support actions/services provided to the beneficiary, tracked separately from notes.
- **Court sittings** — hearing dates tied to the case are scheduled and tracked, with automatic reminders as a date approaches and escalation if a hearing is missed.
- **Travel claims** — a field worker submits an expense claim (with an optional photographed receipt) for travel related to visits on this case; a Coordinator or Director reviews and approves/returns it.

- **Notifications** — relevant users get in-app notifications for things like an upcoming court date, a new handoff, or a travel claim needing review.

Who sees the urgent stuff

The **Crisis Queue** (Coordinators and Directors) is a single prioritized list of time-sensitive items across the whole organisation: cases with a court date in the next 48 hours, cases recently handed off to a new worker, and travel claims waiting on approval — so a supervisor doesn't have to hunt through individual cases to find what needs attention today.

5. Using the web app

The web app's main sections (left-hand navigation):

- **Dashboard** — an overview relevant to your role.
- **Cases** — search, create, and manage cases; each case's detail page has tabs for its stage data, notes, interventions, court sittings, and visits.
- **Crisis Queue** — urgent items (Coordinator/Director only).
- **Travel Claims** — review and approve submissions from field workers (Coordinator/Director), or track your own if you're field staff who also uses the web app.
- **Budgets** — allocations and utilization tracking, with an attachable receipt/bill per record (Director/Coordinator/Accountant).
- **Reports** — generate and export case/operational reports (PDF/Excel).
- **Admin** — user management, invitations, audit log, org-wide settings including 2FA policy (Director only).
- **Settings** — your own account: change password, enable/manage 2FA.

Editing a visit from the web

Field workers primarily manage visits from the mobile app, but a Coordinator or Director can also **reschedule** an upcoming (not yet completed) visit from a case's detail page — useful for correcting a scheduling mistake without needing the assigned field worker to do it themselves. Open the case → **Visits** tab → **Reschedule** on the visit in question, pick a new date/time, and give a reason (this is recorded and visible to everyone on the case). Note: a **completed** visit can't be edited or rescheduled — its record is final once submitted.

6. Using the mobile app

After installing (see [Section 1](#)) and logging in, the main screens (bottom navigation):

- **Today** — your visits scheduled for today, with GPS-verified start/complete actions, a live countdown banner for your next court sitting, and buttons to **Court this week** and **Upcoming visits** (the rest of this week's schedule beyond just today, so you can plan ahead).
- **Cases** — your assigned cases; search/filter, view details, add notes (with photo attachments), interventions, and court sittings.
- **Travel Claims** — submit a new claim with a photographed receipt (from the camera or gallery), and track the status of ones you've already submitted.
- **More** — your sync queue (see below), notifications, and account settings (password, 2FA).

Working offline

The mobile app is built to keep working with a poor or absent connection: actions like starting/completing a visit or submitting a travel claim are queued locally and automatically synced once you're back online. You can check what's still waiting to sync under **More** → **Sync Queue**.

Viewing attachments

Tapping an attachment on a note (photo, PDF) downloads it and opens it in your phone's normal viewer app (e.g. its default photo viewer or PDF reader) — the same file, same encryption-at-rest protection as the web app, just displayed through whatever app your phone already uses for that file type.

7. Security, 2FA, and data protection

- **Encryption** — sensitive personal fields (PII) and uploaded attachments are encrypted at rest in the database/storage; only the app itself (with the correct server-side key) can read them back.
 - **Two-factor authentication (2FA)** — available to every account via **Settings** → **Two-Factor Authentication**, using an authenticator app (TOTP, e.g. Google Authenticator). A Director can make 2FA mandatory for the whole organisation.
 - **Step-up authentication** — some sensitive actions (like revealing a hidden PII field on a POCSO case) require re-confirming your identity via a fresh OTP/TOTP code, even if you're already logged in — this is deliberate friction on genuinely sensitive actions, not a bug.
 - **Audit log** — Directors can review a log of sensitive actions (PII reveals, user suspensions, role changes, etc.) under **Admin** → **Audit Log**.
 - **Session handling** — logging out, or a Director suspending/deactivating your account, immediately invalidates your session on both web and mobile.
-

8. Getting help

If something in the app isn't behaving as expected, the most useful things to note down before asking for help:

- Which app (web or mobile) and, for web, which browser.
- What you were trying to do, and the exact error message shown (if any).
- Your role and roughly what time it happened.

This helps whoever's maintaining the deployment find the relevant detail quickly rather than guessing.
